

SSELFIE Studio - App Summary

What It Is

SSELFIE Studio is a web app that turns a user's selfies into on-brand content and planning outputs with AI assistance.

Who It's For

Women creators and entrepreneurs who want to stay visible online without overthinking content or burning out.

What It Does

- AI stylist chat (Maya) to generate ideas, guidance, and content direction.
- Train a personal AI model from selfies in the Studio flow.
- Generate on-brand photos via AI image generation.
- Plan Instagram feeds with a feed planner and individual feed views.
- Manage galleries and saved images.
- Provide academy content, prompt guides, and a bio generator.

How It Works (Repo Evidence)

- Next.js App Router serves UI pages and API routes under 'app/'.
- API routes call business logic in 'lib/' (Maya, feed planner, credits, subscriptions).
- Data stored in Neon Postgres; auth and storage via Supabase.
- AI chat uses Vercel AI SDK + OpenAI; image generation uses Replicate.
- Files stored in Vercel Blob; caching/rate limiting via Upstash Redis/Search.
- Payments handled via Stripe actions and webhooks.
- Data flow: User page -> API route -> lib logic -> database/external services.

How To Run (Minimal)

- Install Node.js 18+.
- Create '.env.local' with required keys (Database, Supabase, Replicate, Stripe, Upstash, Vercel Blob, App URLs).
- Run 'npm install'.
- Run SQL scripts in 'scripts/' to create required tables.
- Start the dev server with 'npm run dev' and open <http://localhost:3000>.
